Good for Enterprise™: Good Mobile Control™

Secure and Manage Thousands of Mobile Devices From a Single Dashboard

Good Mobile Control gives IT administrators complete control over their entire mobile fleet.

As personal technology like smartphones and other mobile devices become part of the corporate landscape, it's critical that IT departments have the tools to ensure security and compliance. Good Mobile Control offers relief for those IT managers dealing with a diverse range of devices, from smartphones to tablets to ruggedized handhelds, in the workplace.

SECURITY MEETS FLEXIBILITY

Through an easy-to-use web-based console, IT administrators can now enforce company security policies across a variety of the latest devices, provisioning passwords, restricting access to applications, setting data encryption, and remotely locking down or erasing a device that is lost or stolen. IT can easily define all security and management policies and deliver them to the device completely over-the-air. Good Mobile Control provides great flexibility in setting policies based on functional workgroups or roles, and administrators can assign a set of policies across the entire fleet.
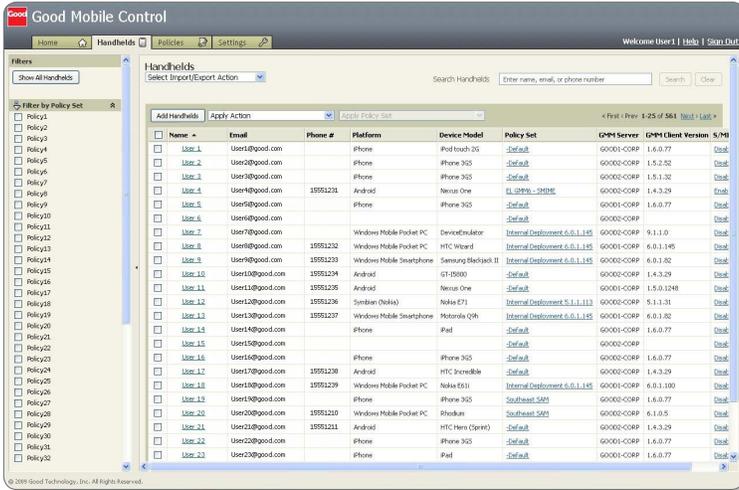

A WINDOW ON YOUR ENTIRE FLEET

From a single web-based dashboard, you get instant insight into the activity of your entire mobile deployment. This end-to-end visibility is not only critical for corporate policy enforcement, but is a valuable asset for troubleshooting and support. Good Mobile Control also provides a set of web services—based APIs for automating management tasks and performing bulk actions.

There's even a self-service option so that IT admins can delegate routine mobile device management actions to end users without generating a support call. Employees can receive messages telling them to initiate an application update, or instructions for tasks such as activating a new mobile device or performing a data wipe of their device.

> *I simply check the console and see exactly who has what device, and whether they're connected. I can also circumvent problems before employees even realize there's an issue.*

Sherri Houmadi, Wireless Manager,
Perkins+Will

Search features help you isolate handhelds by the type of device, policy set, server—or other any criteria—making it easy to locate a user when access needs to be quickly restricted or terminated.

You can conduct all of your rules and role-based administration from any Internet browser, and you can create custom policy sets for groups of users.

> *Now you can control your entire fleet of devices with uniform policies—no matter how many different device types your employees have—from anywhere.*

Brad Reiter, Director of Product Management
Good Technology

FEATURES	BENEFITS
Web-based management console	Manage iPhone devices as well as other platforms from anywhere, anytime
Over-the-air set up	Deliver easy and scalable deployment to end users
Role-based administration	Delegate rights and permissions for different roles (managers, staff, administrators) so employees can perform tasks related to their jobs
Policy-based management	Customize policies for different user groups and assign to one or multiple users at once
Self-service	Reduce IT and helpdesk load by enabling end users to perform basic tasks as allowed by the IT administrator
Define and enforce security policies	Protect access to enterprise data and erase enterprise data when necessary (e.g., remote wipe lost smartphones)
Software distribution	Deploy and update third-party software on handhelds over the air
Search, filter, and perform bulk operations	Easily identify target handhelds among thousands and perform bulk operations
IT dashboard	Get a quick overview of your servers' status and your devices
Connectivity monitor	Track network status and coverage history to troubleshoot connectivity-related problems
